(54) Title: REMOVAL OF BORONIC ACID PROTECTING GROUPS BY TRANSESTERIFICATION

(57) Abstract

A method for the removal of ester protecting groups from α -amino boronic acid is disclosed for the preparation of compounds of the formula: R¹-X_G-NHCH(R²)-B(OH)₂.

Title

Removal of Boronic Acid Protecting Groups by Transesterification

5

10

Field of the Invention

The present invention relates to a process for the removal of ester protecting groups from α -amino boronic acids and corresponding peptide analogs by transesterification with hydrophobic boronic acids.

Background of the Invention

Simple boronic acids are inhibitors of serine proteases. For example, Koehler et al. Biochemistry 10: 2477 (1971) reports that 2-phenylethane boronic acid 15 inhibits chymotrypsin at millimolar levels. synthesis of boronic acid analogs of N-acyl-a-amino acids has yielded more effective inhibitors. AcboroPhe-OH, R-1-acetamido-2-phenylethane boronic acid, inhibits chymotrypsin with a $\text{K}_{\mbox{\scriptsize i}}$ of 4 $\mu\text{\scriptsize M}$ Matteson et al. 20 J. Am. Chem. Soc. 103: 5241 (1981). More recently, Shenvi, US 4,537,773 (1985) disclosed that boronic acid analogs of α -amino acids, containing a free amino group, were effective inhibitors of aminopeptidases. Shenvi, US 4,499,082 (1985) discloses that peptides containing 25 an α -amino boronic acid with a neutral side chain were more effective inhibitors of serine proteases exceeding inhibitors disclosed earlier by as much as 3 orders of magnitude in potency. The chemistry of α -aminoboronic acids was further expanded to the synthesis of peptide. 30 analogs containing boronic acid with positive charged side chains, boroLysine, boroArginine, boroOrnithine, and isothiouronium analogs. This is disclosed in Kettner, et al. EPA 0,293,881, published December 7, 1988. 35

Much progress has been made in the synthesis of boronic acid and corresponding peptides with the

boronic acid protected as an ester. However, a convenient method of removal of the ester protecting group is lacking. Matteson (1981) infra, reports the destructive removal of pinanedial group by treatment with anhydrous BCl3. Kettner and Shenvi J. Biol. Chem. 15106 (1984) describe the removal of the pinacol protecting group by converting the boronic pinacol esters to the thermodynamically more stable, diethanolamine ester by transesterification and then 10 hydrolysis by treatment with aqueous acid or with a cation exchange resin. This method is not applicable for removal of pinanediol ester due to its greater stability. Matteson Chem. Rev. 89: 1535 (1989) describes the removal of the pinanediol group in situ by incubations in borate buffer. It should be noted that 15 the pinanediol ester is preferred in synthesis due to it ability to direct stereochemistry at the α -carbon of boronic acid and its stability to chemical manipulations. The pinanediol protecting group was used 20 almost exclusively in the preparation of boroArginine peptides, shown in EPA 0,293,881. In one example, partial hydrolysis of the pinanediol ester was obtained by binding Ac-(D)Phe-Pro-boroArg-C10H16 to a cation exchange resin and washing extensively with aqueous 25 acetic acid followed by elution with HCl. This reaction is slow, it requires recovery of product by evaporation of large volumes of water and separation of the free boronic acid from the ester . Removal of the pinanediol by treatment with BCl3 as the final step in synthesis 30 was considered to be the only practical method.

35

Summary of the Invention

The present invention provides a method for converting compounds of formula I

$$R^{1}-X_{n}-NHCH(R^{2})-BR^{3}R^{4}$$
(I)

5 to compounds of formula II,

$$R^1-X_n$$
-NHCH (R^2) -B (OH) 2

(II)

wherein for both formula I and formula II

10 R¹ is

15

- a) hydrogen,
- b) an N-terminal protecting group,
- c) -SO₂ (CH₂)_m-aryl, wherein aryl is phenyl, napthyl or biphenyl substituted with one, two or three substituents selected from the group consisting of halo (F. Cl. Br. L.). -CN. Cl-ClO-alkyl, C3-C8-cycloalkyl,
- (F, C1, Br, I,), -CN, C1-C10-alkyl, C3-C8-cycloalkyl, C2-C10-alkenyl, C2-C10-alkynyl, $-OR^7$, $-NO_2$, $-CF_3$, $-S(0)_RR^8$, $-NR^6R^7$, $-COR^7$, $-CO_2R^7$, $-CONR^6R^7$;

X is a peptide of 1-20 amino acids;

- 20 R² is
 - a) C1-C10-alkyl,
 - b) C2-C10-alkyl-Y,
 - c) $-(CH_2)_n$ -aryl, wherein aryl is as defined above;

Y is

- a) $-NHC(NH)NH_2$,
 - b) $-NH_2$,
 - c) $-SC(NH)NH_2$,
 - d) $-OR^9$,
 - e) -SR⁹;
- 30 R^3 and R^4 are
 - a) C1-C8-alkoxy, or
 - b) when taken together \mathbb{R}^3 and \mathbb{R}^4 form a cyclic boronic ester where said chain or ring contains from 2 to 20 carbon atoms and, optionally, a heteroatom which
- 35 can be N, S, or O; R⁵ and R⁶ are independently
 - a) H,

```
b) C1-C8-alkyl,
```

- c) C1-C8-alkoxy,
- d) C3-C8-cycloalkyl,
- e) $-CO_2R^7$,

f) $-(CH_2)_m$ -phenyl;

 R^7 is

- a) H,
- b) phenyl,
- c) benzyl,
- 10 d) C1-C8-alkyl;

R⁸ is

- a) phenyl,
- b) C1-C4-alkyl,
 - c) C1-C4-alkoxy,

15 d) $-CF_3$;

 R^9 is

- a) H,
- b) C1-C2-alkyl,
- c) phenyl or phenyl optionally substituted with a substituent selected from the group consisting of halo (F, Cl, Br, I), -CN, Cl-Cl0-alkyl, C3-C8-cycloalkyl, C2-C10-alkenyl, -C2-C10-alkynyl, -OR⁷, -NO₂, -CF₃,-S(O)_rR⁸, -NR⁶R⁷, -COR⁷, -CO₂R⁷, -CONR⁶R; wherein R⁵, R⁶, and R⁸ are as defined above;
- 25 n is 0 or 1; m is 0 to 2; r is 0 to 2;

which comprises reacting a compound represented by

formula I in a mixture of water and a water-immiscible
organic solvent containing an organic boronic acid
acceptor present in an amount equal to at least 1
equivalent of the compound of formula I, stirring the
mixture at a temperature in a range of from about 5 to

about 35°C, for a time of approximately 1 hour, allowing
the mixture to then separate into two distinct phases,

separating the phases and then recovering the desired compound of formula II from the separated aqueous phase.

5 Detailed Description of the Invention

As used throughout the specifications, the following abbreviations for amino acid residues or amino acids apply:

Ala = L-alanine

10 Arg = L-arginine

Asn = L-asparagine

Asp = L-aspartic acid

Cys = L-cysteine

Gln = L-glutamine

15 Glu = L-glutamic acid

Gly = glycine

His = L-histidine

Ile = L-isoleucine

Leu = L-leucine

20 Lys = L-lysine

Met = L-methionine

Phe = L-phenlyalanine

Pro = L-proline

Ser = L-serine

25 Thr = L-threonine

Trp = L-tryptophan

Tyr = L-tyrosine

Val = L-valine

The "D" prefix for the foregoing abbreviations indicates

30 the amino acid is in the D-configuration. "D,L" indicates the amino is present in mixture of the D- and the L-configurations.

Other abbreviations used throughout the description

35 below

are:

Me = methyl

	Et	= ethyl
	Вос	= t-butoxycarbonyl
	Z	= benzyloxycarbonyl
	2C1z	= 2-chlorobenzyloxycarbonyl
5	4Clz	= 4-chlorobenzyloxycarbonyl
	p-N02-Z	= p-N0 ₂ benzyloxycarbonyl
	AC	= acetyl
	Adc	= adamantyloxycarbonyl
	DIPA	= diisopropylamine
10	DIPEA	= diisopropylethylamine
	DCHA	= dicyclohexylamine
	DBU	= 1,8-diazabicyclo[5.4.0]undec-7-ene
-	DABCO	= 1,4-diazabicyclo[2.2.2]octane
	NMM	= N-methylmorpholine
15	DMAP	= 4-dimethylaminopyridine
	FSA	<pre>= formamidinesulfinic acid</pre>
	FAB/MS	= fast atom bombardment mass
	spectrometry	$MS(NH_3-C1) = chemical$
	ionization mass	spectrometry
20	NMR	= nuclear magnetic resonance
	spectrometry	

The following reagents were obtained from commercial sources: l-hydroxybenzotriazole • H2O,

adamantylfluoroformate, di-t-butyldicarbonate, benzyloxycarbonyl chloride, 2-chlorobenzyloxycarbonyl chloride, N-hydroxysuccinimide, formamidinesulfinic acid, 32% peracetic acid.

Boc-Pro-boroOrn-C₁₀H₁₆, Ac-(D)Phe-Pro-boroOrn-30 C₁₀H₁₆, BocPhe-boroOrn-C₁₀H₁₆ benzenesulfonic acid were prepared by the procedure described in EP0293881A2, pl2-13.

The prefix "boro" indicates amino acid residues where the carboxy group is replaced by a boronic acid (formula II, R^3 and R^4 = -OH).

The pinanediol boronic acid ester and the pinacol boronic acid ester are abbreviated "-C10H16" and "C6H12",

respectively. Other illustrations of diols useful for deriving a boronic acid esters are 1,2-ethanediol, 1,3-propanediol, 2,3-butanediol, 1,2-diisopropylethanediol, 5,6-decanediol, 1,2-dicyclohexylethanediol.

Note that throughout the text when an alkyl substitutent is mentioned, the normal alkyl structure is meant (e.g. butyl is n-butyl) unless otherwise specified. However, in the definition of radicals above (e.g. R²), both branched and straight chains are included in the scope of alkyl.

It is understood that many of the compounds of the present

invention contain one or more chiral centers and that
these stereoisomers may possess distinct physical and
biological properties. The present invention comprises
all of the stereoisomers or mixtures thereof. If the
pure enantiomers or diastereomers are desired, they may
be prepared using starting

15 materials with the appropriate stereochemistry, or
20 may be separated from mixtures of undesired
stereoisomers by standard techniques, including chiral
chromatography and recrystallization of diastereomeric
salts.

"N-terminal protecting group" as used herein,

- refers to various art recognized amino-terminal protecting groups employed in peptide synthesis. Examples of suitable groups include formyl, acetyl, benzoyl, trifluoroacetyl, and methoxysuccinyl; aromatic urethane protecting groups, such as, benzyloxycarbonyl; and aliphatic urethane protecting groups, such as t-benzyloxycarbonyl or adamantyloxycarbonyl. Gross and
 - t-benzyloxycarbonyl or adamantyloxycarbonyl. Gross and Meinhoffer, eds., The Peptides, Vol. 3; 3-88 (1981), Academic

 Press New York 1981 disclose numerous suitable amine
- 35 Press, New York 1981, disclose numerous suitable amine protecting groups and is incorporated herein by reference for

15

20

that purpose.

"Peptide of 1-20 amino acids" as used herein, refers to a peptide chain of one to twenty natural or unnatural amino

acids of either D- or L-configuration. Roberts and Vellaccio, The Peptides, Vol. 5; 341-449, Academic Press, New York 1983, disclose numerous suitable natural and unatural amino acids and is incorporated herein by reference for that purpose. This term is also intended to include sidechain protected amino acid residues that are commonly employed in peptide synthesis such as those disclosed in the Peptides, Vol 3, 3-88 (1981). This reference is incorporated herein by reference for that purpose.

It should be noted that to yield a compound of formula II where X is a peptide, optionally, the N-terminal or sidechain protecting groups can be removed by using procedures well known to those skilled in the art. For example, where the N-terminal or side chain protecting group is BOC, the BOC group can be removed by treatment with Anhydrous HCL. Where the N-terminal or side chain protecting group is Z, the Z group can be removed by means of catalytic hydrogenation.

25

30

The present invention relates to the synthesis of free boronic acids (compounds of formula II) from ester precursors by transesterification reactions with aliphatic and aromatic boronic acids under heterogeneous reaction conditions.

Water Barrell

and the specification of the second of the s

5 Scheme 1

10

This novel method is readily applicable to compounds where the R² side chain is positively charged as shown in Scheme 1 where R² is the 3-guanidino-propyl moiety. In this example, the protected boronic acid ester, Ac-15 (D) Phe-Pro-boroArg-C10H16, is suspended in a mixture consisting of water, an equal volume of diethyl ether, and 5 equivalents of phenyl boronic acid. The flask is stoppered and allowed to stir rapidly with a magnetic stirrer at room temperature. Two clear phases are 20 observed after 15-30 min. Stirring is continued for 3 The reaction mixture is transferred to a separatory funnel where the phases are separated. The aqueous phase is then washed with two portions of ether. is removed by evaporation at 35-43°C at a reduced 25 pressure. Products are usually obtained as white foams after drying in vacuo, with KOH and P2O5 and are readily converted to amorphous white solids by triturating with ether.

boroLys-C10 H16

H-boroVal-C6H12

MeOSuc-Ala-Ala-Pro-(D,L)boroVal-C6H12

The above process depends on the final product being more soluble in the aqueous phase than the organic phase. This criteria is readily met for compounds such as the boroArginine, boroLysine, and boroOrnithine peptides as well as analogs were the isothiouronium group replaces the guanidino group. It is applicable to compounds in US 4,537,773 and US 4,499,082 which describe α -aminoboronic acids with neutral side chains

10

and peptides containing a-aminoboronic acids with neutral side chains, respectively. For removal of the ester protecting group from α -aminoboronic such as HboroVal-C6H12, this method should be generally applicable since these compounds are readily soluble in water due to the presence of the free α -amino group. should be applicable to a large number of less hydrophobic peptide boronic acids which are readily soluble in water. For example, the pinacol protecting group of MeOSuc-Ala-Ala-Pro-boroVal-OH is readily 10 removed by the method of the present invention. However, it will be desirable to run trial reactions on a small scale to determine the solubility of the free boronic acid product and the feasibility of this method. For more hydrophobic compounds in this series, it maybe 15 necessary to design a synthetic protocol were the transesterification step is applied to intermediates containing charged residues.

The use of a biphasic system with the organic phase consisting of diethyl ether and phenyl boronic 20 appears to be ideal for the preparation of most free boronic acids. This method will be applicable to the removal of other boronic acid protecting groups represented by \mathbb{R}^3 and \mathbb{R}^4 in formula (I). Specific examples, in addition to the pinanediol and pinacol groups, are where R3 and R4 taken together form a moiety derived from 1,2-ethanediol, 1,3-propanediol, 2,3butanediol, 1,2-diisopropylethanediol, 5,6-decanediol, or 1,2-dicyclohexylethanediol. The protecting groups can also be where \mathbb{R}^3 and \mathbb{R}^4 are derived from alcohols 30 such as isopropanol, methanol, ethanol or n-propanol. Of course, R³ and R⁴ can each be derived from the same alcohol or from different alcohols, if desired.

Organic solvents other than diethyl ether can be used in the method of the invention. It is only necessary that the organic solvent be water immiscible. Suitable choices of other organic solvents are

15

30

carbonteterachloride, chloroform, methylenechloride, ethyl acetate, benzene, tolulene or hexane.

Boronic acid acceptors for the ester protecting group other than phenyl boronic acid also can be used in the method of the invention. It is only necessary that the acceptor boronic acid, both in its free form and in its esterified form, have greater solubility in the organic phase than in the aqueous phase. Suitable choices of other acceptor boronic acids are butyl boronic acid, pentyl boronic acid, hexyl boronic acid or cyclohexyl boronic acid.

For the method of invention, the ratio of water to organic solvent in the mixture in which the ester precursor of formula (I) is suspended can vary widely. It is important that sufficient volumes of water and organic solvent be present to completely dissolve the products of the reaction (acceptor boronic acid plus ester for the organic phase and free boronic acid for the aqueous phase).

20 For the method of the invention, the amount of acceptor boronic acid in the reaction mixture should be an amount equal to at least a molar equivalent of the ester precursor of formula (I) present in said mixture. Generally, it is preferable to have the acceptor boronic 25 acid present in an amount in excess of an equimolar amount, the most preferred amount-being a range of from 3 to 5 equivalents.

. The time of stirring the reaction mixture can vary over wide limits depending on the ester precursor and the acceptor boronic acid involved. Usually, the minimum time for stirring is 1 hour, but can vary from 0.2 to 48 hours.

In the method of the invention, the desired product compound of formula (II) is recovered from the 35 aqueous phase after its separation from the two phase system formed from stirring the reaction mixture. This

and the second of the second o

15

30

is best accomplished by the removal of water from the aqueous phase by means well understood by those skilled in the art, such as with a rotary evaporator.

NMR, proton nuclear magnetic resonance, chemical shifts are reported in δ units, parts per million downfield from the internal tetramethylsilane standard. Elemental analyses were conducted by Galbraith Laboratories Inc., Knoxville, TN and Microanalysis Inc., Wilmington, DE. FAB/MS samples of free boronic acids did not give consistent results making it difficult to monitor the removal of ester protecting groups difficult by this means. However, the presence of the pinanedicl and the pinacol groups are readily observed in NMR spectra. For the pinanediol ester, a methyl group is observed at $\partial 0.9$ and the methyl groups of the pinacol groups are observed as singlet at δ 1.1 Following the removal of pinanediol protecting group, FAB/MS were run by treating the sample with ~2 equivalents of pinacol in methanol for 5 min and evaporating the solvent. Similarly, FAB/MS samples of free boronic acid, obtained

Similarly, FAB/MS samples of free boronic acid, obtained by removal of the pinacol, were prepared by treating with pinanediol.

Example 1

25 Preparation of Ac-(D)Phe-Pro-boroArg-OH•benzene, sulfonic acid.

The synthesis of Ac-(D)Phe-Pro-boroArg-C₁₀H₁₆•benzene sulfonic acid has been described previously, Kettner et al. *J. Biol Chem* **265**: 18289 (1990).

Ac-(D)Phe-Pro-boroArg-C₁₀H₁₆•benzene sulfonic acid (0.20 g, 0.27 mmoles) and phenyl boronic acid (0.16 g, 1.3 mmoles) were suspended in a mixture consisting of 5 ml of water and 5 ml of ether. The mixture was stirred overnight at room temperature. The two phases were separated, the organic phase was washed with water, and the aqueous phase was washed with ether. The combined

aqueous phases was evaporated to vield 0.14 g of product. NMR was consistent with the desired structure and the product obtained in Example 2.

5

Example 2

Preparation of Ac-(D)Phe-Pro-boroArg-OH·HCl, Ac-(D)Phe-Pro-boroArg-C10H16 benzene sulfonic acid (6.4 g, 8.5 mmoles) and phenyl boronic acid (5.2 g, 42mmoles) were suspended in 150 ml of water and 150 ml of ether. The mixture was stirred overnight. The phases 10 were separated and the ether phase was washed with two 100 ml portions of water. The combined aqueous phases were washed with ether. The aqueous phase was concentrated to ~50 ml by evaporation and then it was passed through a column containing 15 ml of BioRadTM 15 AG1-X8 (Cl form). The aqueous phase was further concentrated to ~2 ml and it was chromatogramed on a 2.5 x 100 cm column containing BioRad $^{\mathbf{m}}$ P2 resin and equilbrated with 1.0 mM HCl. Fractions containing the desired product were pooled, evaporated, dried in vacuo. 20 and triturated with ether to yield 3.4 g. Anal. Calcd. for C21H34N6O5BC1: C= 50.77%,

H=6.91%, N=16.92%, and B=2.18%. Found: C=50.91%, H=6.97%, N=16.91%, B=2.29%.

25

30

Example 3

Preparation of Ac-Phe-Pro-boroArg-OH•HCl The starting material for this reaction, Ac-Phe-Pro-boroArg-C10H16. HCl, was prepared by coupling Ac-Phe-OH to H-Pro-boroArg-C10H16. The intermediate Boc-ProboroOrn-C10H16 was prepared by the procedure described in EPA 0 293 881 and it was guanidated using 35 aminoiminomethane sulfonic acid [Mosher et al. Tetrahedral Lett. 29: 3183 (1988)]. Boc-Pro-boroOrn-C10H16 benzene sulfonic acid (4.8 g, 10.4 mmoles) was

dissolved in 50 ml of absolute ethanol; 4dimethylaminopyridine (2.5 g, 20.7 mmoles) and
aminoiminomethane sulfonic acid (2.6 g, 20.7 mmoles)
were added. The mixture was refluxed at 80°C for 3 hrs.
It was cooled and solids were removed by filtration.
Solvent was evaporated, the residue was dissolved in
chloroform, and it was washed with 0.2 N HCl prepared in
saturated aqueous NaCl and with saturated aqueous NaCl.
After drying over anhydrous sodium sulfate, solvent was
evaporated to yield 5.4 g of a foam. This material was
dissolved in methanol and it was chromatogramed on a 2.5
x 100 cm column of SephadexTM LH-20 using methanol as a
solvent. Product, 4.4 g, was obtained. FAB/MS calcd.

H-Pro-boroArg-C10H16*2HCl was prepared by dissolving Boc-Pro-boroArg-C10H16*HCl (1.3 g, 2.4 mmoles) in 10 ml of dioxane and adding 10 ml of 3.3 N HCl: dioxane. After stirring for 2 hrs, solvent was evaporated and the residue was triturated with ether to yield 1.2 g of product. FAB/MS calcd. for M (C20H36N5O3B) + H: 406.43. Found: 406.38.

Ac-Phe-OH (87 mg, 0.42 mmoles) was coupled to H-

for M (C25H44N5O5B) + H: 506.56. Found: 506.49.

Pro-boroArg-C10H16.2HC1 (200 mg, 0.42 mmoles) using the carbodiimide procedure. The starting materials were dissolved in 20 ml of methylene chloride, N-methylmorpholine (92 µl, 0.84 mmoles), 1-hydroxybenzotriazole.H2O (130 mg, 0.84 mmoles), and dicyclohexylcarbodiimide (86 mg, 0.42 mmoles) were added. After stirring overnight at room temperature, the reaction mixture was filtered, the filtrate evaporated, and the residue was chromatogramed 2.5 x 50 cm column of LH-2O using methanol as a solvent. The desired product was obtained in a yield of 240 mg. FAB/MS calcd. for M (C31H47N6O5B) + H: 595.66. Found: 35 595.41.

Ac-Phe-Pro-boroArg-C₁₀H₁₆•HCl (0.13 g, 0.21 mmoles) and phenyl boronic acid (0.13 g, 1.0 mmoles)

were dissolved in a mixture of 5 ml of water and 5 ml of ether. The mixture was stirred 3 hrs at room temperature. The reaction phases were separated and the aqueous phase was extensively washed with ether. Water was evaporated and the residue dried to yield 0.11 g. The product was triturated with ether to yield a white solid. FAB/MS calcd. for the pinacol ester, M (C27H43N6O5B) + H: 543.58. Found: 543.48.

10

Example 4

Preparation of Ac-Pro-boroArg-OH•HCl Ac-Pro-boroArg-C10H16.HCl was prepared by dissolving H-Pro-boroArg-C10H16.2HCl (200 mg, 0.41 mmoles) in 1 ml of dioxane: water (1:1) and adding acetic anhydride (59 μ l, 0.63 mmoles) and sodium 15 bicarbonate (110 mg, 1.2 mmoles). The reaction was allowed to stir 30 min at room temperature, it was acidified with HCl, diluted with methanol, and evaporated. It was redissolved in methanol and chromatogramed on 2.5 \times 50 cm column of LH-20. 20 Fractions containing the desired product were pooled, evaporated, and triturated with ether to yield 140 mg. FAB/MS calcd. for M (C22H38N5O4B) + H: 447.97. 448.43.

The conditions in Example 3 were used to prepare the free boronic acid of Ac-Pro-boroArg-C10H16·HCl (0.12 g, 0.24 mmoles). After triturating the product with ether, 0.080 g of Ac-Pro-boroArg-OH·HClwere obtained. FAB/MS calcd. for the pinacol ester, M (C18H34N5O4B) + 396.39. Found: 396.3.

- Example 5

Preparation of Ac-Gly-boroArg-OH•benzene sulfonic acid
Boc-Gly-boroArg-C10H16 (10.2 g) was prepared from
Boc-Gly-boroOrn-C10H16•benzene sulfonic acid (12.5 g,
21.5 mmoles) by the procedure described in EPA 0 293

10

881. FAB/MS calcd. for M (C22H40N5O5B) + H: 466.32. Found: 466.59.

H-Gly-boroArg-C₁₀H₁₆•HCl, benzene sulfonic acid was prepared by deblocking Boc-Gly-boroArg-C10H16 with HCl: dioxane.

Ac-Gly-boroArg-C10H16 benzene sulfonic acid was prepared by the procedure described for Ac-Pro-boroArg-C10H16 in Example 4. FAB/MS calcd. for M (C19H34N5O4B) + H: 407.90. Found: 408.36.

The condition described for Example 3 were used to prepare the free boronic acid. Ac-Gly-boroArg-C10H16 benzene sulfonic acid (0.064 g, 0.11 mmoles) yielded 33 mg of Ac-Gly-boroArg-OH•benzene sulfonic acid. FAB/MS calcd. for the pinacol ester, M (C₁₅H₃₀N₅O₄B) + H: 356.32. Found: 356.3.

Example 6

Preparation of Ac-(D)Phe-Gly-boroArg-OH.benzene sulfonic acid

Ac-(D)Phe-Gly-boroArg-C10H16 benzene sulfonic acid 20 was prepared by coupling Ac-(D)Phe-OH to H-Gly-boroArg-C10H16 using a modification of the carbodiimide procedure described in Example 3. For this coupling, 2 ml of dimethylformamide was used with 20 ml of methylene chloride as a solvent. FAB/MS calcd. for M 25 $(C_{28}H_{43}N_{6}O_{5}B) + H: 555.59$. Found: 555.38.

The procedure described in Example 3 was used to prepare the free boronic acid. Ac-(D)Phe-Gly-boroArg-C10H16 benzene sulfonic acid (0.10 g, 0.14 mmoles) yielded 72 mg of Ac-(D)Phe-Gly-boroArg-OH•benzene sulfonic acid. FAB/MS calcd. for the pinacol ester M (C24H39N6O5B) + H: 503.51. Found: 503.32.

But I have been the state of the second control of the second cont

Example 7

Preparation of Boc-(D)Phe-Gly-boroArg-OH•HCl Boc-(D)Phe-Gly-boroArg-C10H16 was prepared by coupling Boc-(D)Phe-OH to the dipeptide analog using the

mixed anhydride procedure. The mixed anhydride of Boc-(D) Phe-OH (95 mg, 0.36 mmoles) was prepared by dissolving the acid in 3 ml of anhydrous tetrahydrofuran and adding N-methylmorpholine (40 μ l, 0.36 mmoles), and isobutyl chloroformate (46 μ l, 0.36 mmoles) at -20°C. After 5 min, triethylamine (50 µl, 0.36 mmoles) and 10 ml of cold tetrahydofuran were added and the mixture was immediately added to a 0°C solution of H-Gly-boroArg-C10H16 benzene sulfonic acid, HCl (200 mg, 0.36 mmoles) 10 in 6 ml of chloroform. After allowing the reaction to warm to room temperature and to stir several hrs, it was filtered and solvent was evaporated. The residue was chromatogramed on a 2.5 x 50 cm column of LH-20 in methanol to yield 210 mg of the desired product. 15 calcd. for M $(C_{31}H_{49}N_{6}O_{6}B) + H$: 613.39. Found: 613.65.

The procedure described in Example 3 was used to convert Boc-(D)Phe-Gly-boroArg-C10H16*HCl (0.050 g, 0.077 mmoles) to 36 mg of Boc-(D)Phe-Gly-boroArg-OH*HCl.

FAB/MS calcd. for the pinacol ester, M (C27H45N6O6B) + H: 561.60. Found: 561.4.

30

Example 8

Preparation of Ac-Phe-Gly-boroArg-OH•benzene sulfonic acid

Ac-Phe-Gly-boroArg-C10H16 benzene sulfonic acid was prepared by coupling Ac-Phe-OH to H-Gly-boroArg-C10H16 using the carbodimide procedure described in Example 3. FAB/MS calcd for M (C24H39N6O5B). 503.51. Found: 503.3.

Ac-Phe-Gly-boroArg-C10H16*benzene sulfonic acid (0.075 g, 0.10 mmoles) was treated with phenyl boronic acid by the procedure in Example 3 to yield Ac-Phe-Gly-boroArg-OH*benzene sulfonic acid. FAB/MS calcd. for the

pinacol ester, M (C27H43N4O5B) + H: 515.48. Found: 515.3.

Example 9

5 Preparation of Ac-(D)Phe-Pro-boroLys-OH•benzene sulfonic acid

The intermediate, NH2-CH[(CH2)4Br]BO2C10H16•HCl was prepared by the procedure described for the analogous compound, NH2-CH[(CH2)3Br]BO2C10H16•HCl, in EPA 0 293 88Q. Also by analogous reactions, Ac-(D)Phe-Pro-NH-CH[(CH2)4Br]BO2C10H16, Ac-(D)Phe-Pro-NH-CH[(CH2)4N3]BO2C10H16, and Ac-(D)Phe-Pro-NH-CH[(CH2)4NH2]BO2C10H16•benzene sulfonic acid (Ac-(D)Phe-Pro-boroLys-C10H16•benzene sulfonic acid) were prepared.

Ac-(D)Phe-Pro-boroLys-C10H16 benzene sulfonic acid (0.50 g, 0.76 mmoles) was treated with phenyl boronic acid by the procedure described in Example 3 to yield Ac-(D)Phe-Pro-boroLys-OH benzene sulfonic acid (0.35 g). FAB/MS calcd. for the pinacol ester, M (C27H43N4O5B) +

20 H: 515.48. Found: 515.3.

Example 10

Preparation of the Isothiouronium Analog of Ac-(D)Phe-Pro-boroArg-OH

Ac-(D)Phe-Pro-NH-CH[(CH₂)3-S-C(NH)-NH₂]BO₂-C₁₀H₁₆•HBr. was prepared by the procedure described in EPA 0 293 881. The corresponding bromide was treated with thiourea to yield the desired produce as an amorphous white solid. Anal. Calcd. for C₃₁H₄7N₅SBBr: C=53.75%, H=6.85%, N=10.11%, B=1.56%. Found: C=53.18%, H=6.68%, N=9.47%, and B=1.50%. FAB/MS calcd. for the pinacol ester, M (C₃₁H₄6N₅SB) + H: 612.71. Found: 612.36.

Ac-(D)Phe-Pro-NH-CH[(CH₂)3-S-C(NH)-NH₂]BO₂-C₁₀H₁₆•HBr (1.0 g, 1.4 mmoles) was allowed to react with phenyl boronic acid by the procedure in Example 3 to

yield 0.66 g of the desired product, Ac-(D)Phe-Pro-NH-CH[(CH₂)3-S-C(NH)-NH₂]B(OH)₂•HBr. Anal. Calcd. for C₂1H₃3N₅O₅SBBr: C=45.17%, H=5.97%, N=12.55%, and B=1.93%. Found: C=44.78%, H=5.58%, N=12.23%, and B=1.85%. FAB/MS calcd. for the pinacol ester, M (C₂7H₄2N₅O₅BS) + H: 560.31. Found: 560.41.

Example 11

and the second of the

Preparation of MeOSuc-Ala-Ala-Pro-(D,L)boroVal-OH

The synthesis of MeOSuc-Ala-Ala-Pro-(D,L)boroValC6H12 has been described previously, Kettner and Shenvi

J. Biol. Chem. 259: 15106 (1984). The pinacol ester
(100 mg, 0.17 mmoles) was allowed to react with 5
equivalent of phenyl boronic acid using the conditions
described in Example 3. The aqueous phase was
evaporated to yield 92 mg of MeOSuc-Ala-Ala-Pro(D,L)boroVal-OH. NMR indicated only a trace (<10%) of
the pinacol group remained. FAB/MS calcd. for the
pinanediol ester, M (C30H49N4O8B) + H: 605.65. Found:

Example 12

Preparation of H-(D,L)boroVal-OH
H-(D,L)boroVal-C6H12*trifluoroacetic acid (100 mg,
0.32 mmoles), described in Kettner and Shenvi (1984) was
allowed to react with phenyl boronic acid by the
procedure in Example 3. H-(D,L)boroValOH*trifluoroacetic acid was obtained in a yield of 76
mg. NMR was consistent with the desired structure
indicating the complete absence of the pinacol group.
FAB/MS calcd. for the pinanediol ester, M (C14H26NO2B) +
H: 252.22. Found: 252.2.

Example 13

Preparation of hydrocinnamoyl-Pro-boroLys-OH benzene sulfonic acid.

Hydrocinnamoyl-Pro-boroLys-C10H16 benzene sulfonic acid was prepared by the general procedure described in

EPA 0 293 881 and was allowed to react with phenyl boronic acid by the procedure in Example 3. The desired product was obtained in a yield of 92%. MS calcd. for M(C19H30N3O4B)+H-2H2O: 340.0. Found: 340. Anal Calcd. for C35H50N3O7SB: c=62.96%, H=7.55%, N=6.29%, B=1.62%. Found: C=62.75%, H=7.47%, N=6.28%, B=1.64%.

What is Claimed is:

 A method for the preparation of a compound of formula (II)

$$R^{1}-X_{n}-NHCH(R^{2})-B(OH)_{2}$$
 (II)

wherein

- 10 R¹ is
 - a) hydrogen,
 - b) an N-terminal protecting group,
- c) $-SO_2(CH_2)_m$ -aryl, wherein aryl is phenyl, napthyl or biphenyl substituted with one, two or three
- substituents selected from the group consisting of halo (F, C1, Br, I,), -CN, C1-C10-alkyl, C3-C8-cycloalkyl, C2-C10-alkenyl, C2-C10-alkynyl, -OR⁷, -NO₂, -CF₃, -S(O)_rR⁸, -NR⁶R⁷, -COR⁷, -CO₂R⁷, -CONR⁶R⁷;

X is a peptide of 1-20 amino acids;

- $20 R^2 is$
 - a) C1-C10-alkyl,
 - b) C2-C10-alkyl-Y,
 - c) $-(CH_2)_n$ -aryl, wherein aryl is as defined above;

Y is

- 25 a) $-NHC(NH)NH_2$,
 - b) $-NH_2$,
 - c) $-SC(NH)NH_2$,
 - $d) OR^9$
 - e) -SR⁹;
- 30 R^5 and R^6 are independently
 - a) H,
 - b) C1-C8-alkyl,
 - c) C1-C8-alkoxy,
 - d) C3-C8-cycloalkyl,
- 35 e) $-CO_2R^7$,
 - f) (CH₂)_m-phenyl;

- a) H,
- b) phenyl,
- c) benzyl,
- d) C1-C8-alkyl;
- 5 R⁸ is
 - a) phenyl,
 - b) C1-C4-alkyl,
 - c) C1-C4-alkoxy,
 - d) -CF3;
- 10 R⁹ is
 - a) H,
 - b) C1-C2-alkyl,
- c) phenyl or phenyl optionally substituted with a substituent selected from the group consisting of halo (F, Cl, Br, I), -CN, Cl-Cl0-alkyl, C3-C8-cycloalkyl, C2-Cl0-alkenyl, C2-Cl0-alkynl, -OR⁷, -NO₂, -CF₃, -S(O)_rR⁸, -NR⁶R⁷, -COR⁷, -CO₂R⁷, -CONR⁶R⁷;

n is 0 or 1; 20 m is 0 to 2; r is 0 to 2;

comprising suspending a compound of the formula

25 $R^1-X_n-NHCH(R^2)-BR^3R^4$

(I)

wherein R^1 , R^2 , X, Y, R^5 , R^6 , R^7 , R^8 , R^9 , n, m and r are as defined above; and

30 R^3 and R^4 are

35

- a) C1-C8-alkoxy, or
- b) when taken together R³ and R⁴ form a cyclic boronic ester where said chain or ring contains from 2 to 20 carbon atoms and, optionally, a heteroatom which can be N, S, or O; R³ and R⁴, independently, are optionally, a heteratom which can be N, S, or O,

in a mixture of water and a water-immiscible organic solvent containing an organic boronic acid acceptor present in an amount equal to at least 1 equivalent of said compound of formula (I), stirring said system for approximately one hour

stirring said system for approximately one hour before allowing the reaction mixture to separate into two distinct phases, separating the phases, and recovering the compound of formula (II) from the separated aqueous phase.

10

15

5

- 2. The method of claim 1 wherein the water-immiscible organic solvent is selected from the group consisting of diethyl ether, carbonteterachloride, chloroform, methylene chloride, ethyl acetate, benzene, toluene or hexane.
- 3. The method of claim 2 wherein the organic boronic acid acceptor is phenyl boronic acid.
- The method of anyone of claims 1 to 3 wherein the amount of organic boronic acid receptor present in the suspending step is in the range of 3 to 5 molar equivalents of the amount of the compound of formula (I) present in said step.

The state of the s

into in the execution of the collinaries.

.

25

5. The method of claim 1 wherein the compound of formula (II) is recovered from the seperated aqueous phase by the evaporation of water from said phase.

30

6. The method of claim 5 wherein the evaporation of water is by means of a rotary evaporator.

The state of the state of the state of the
